

# Woodland Understands the Importance of Water Management.

Woodland understands how crucial flashing techniques are for the waterproofing process that protects your home from rot, mildew, and structural damage. Proper flashing prevents water from seeping in around a window.

We follow the window manufacturer's proper flashing installation recommendations as well as local building codes. We take added measures if we think it's indicated to ensure a water tight barrier.

We always use a sill pan flashing with proper drainage, perimeter flashing to protect against water infiltration and a sealant with finishing that's appropriate for your home's exterior substrate or finish materials.

**This is what it looks like when water management is done right.**

For our jobs, flashing installation isn't an option, it's one of most important aspects of a good installation. Always ask your contractor to discuss the details of their process and insist on a proper flashing application.

If you want it done right, call Woodland or stop by our showroom to see our replacement window displays featuring water sealing barriers.
